Atticus Earn & Protect

One-tap institutional collar protection for custodied trading positions. Prepared for Fireblocks, August 2026.

WHAT IT IS

A client taps one toggle. Their position gets a hard price floor (about 5 to 6% below spot) and pays them a daily cash credit, funded by the options market: we sell the capped upside and buy the floor on listed BTC options, and the net premium is the client's credit. The credit vests through the day; the client can close anytime and keep what vested. If price touches the cap, the cycle auto-unwinds (client keeps position, gains, and vested credit) and re-arms at the new spot. When the market cannot fund an honest credit, the engine refuses to open.

Toggle on: credit plus floor. Toggle off: neither. Everything else identical.

> **Why it fits Fireblocks:** the entire product is read-only. No keys, no deposits, no custody change: positions are read from public data, hedged externally from our own account, and credits pay only to the client's address. A Fireblocks client gets downside protection and daily yield while every asset stays exactly where it is: in your vaults. Protection with zero custody movement is a feature your account teams can sell on day one.

TRACK RECORD (MACHINE-AUDITED SHADOW FACILITY, REAL MARKET PRICES)

35 days	89	$4.45M	+4.5 bps	100%	0
CONTINUOUS OPERATION	POSITIONS SETTLED	NOTIONAL SETTLED	CLIENT ALL-IN NET	ORACLE VERIFIED AND RECONCILED	PEAK NET EXPOSURE

Verdict: TRACK RECORD CLEAN. Includes a 7.5% single-day move where floors and caps engaged as designed with no manual intervention and the book recovered to a positive cumulative result. Live execution separately proven with founder capital on OKX listed options; every hedge auditable to an exchange fill. Full report available.

STRUCTURE AND EXECUTION

ELEMENT	DETAIL
Risk posture	Delta neutral by construction. Every wrap is hedged leg for leg at open; both legs fill or the pair auto-unwinds. Atticus revenue is a published fee on credits sourced, never trading P&L.
Execution stack	OKX listed options, live and production-proven today. FalconX onboarded for block and RFQ execution as volume nets up (adapter built). The stack aligns with Fireblocks' existing OKX and FalconX relationships.
Client economics	Approximately 8.5 bps/day gross credit on protected notional at block execution (measured). Client keeps 80%+ of every credit.
Controls	Withdrawal-disabled venue keys, 40% collateral buffer never allocated, auto-pause at utilization line, kill switch that stops new exposure while payouts continue, concentration caps, full reconciliation against venue records.

PARTNERSHIP ECONOMICS (INDICATIVE, OPEN TO STRUCTURE)

MONTHLY CREDITS ORIGINATED VIA FIREBLOCKS CLIENTS	PARTNER SHARE OF ATTICUS TAKE
Up to $250k	30%
$250k to $1M	40%
Above $1M	50%

Atticus take is approximately 20% of credits sourced (about 1.7 bps/day of protected notional). Tiers reward scale; all terms open to discussion. White-label available: the product ships under your brand, powered by Atticus.

PROPOSED NEXT STEP

1. Client-profile simulation (attached): a composite Fireblocks client: crypto-native fund with BTC treasury in custody and an active perp book, run against our measured rates, showing credits, floor events, and stress-day behavior. **2. Live branded demo:** a working instance of the product, branded for Fireblocks, pricing real positions in one click. **3. Design-partner pilot:** one named client, requirements defined by your team, live inside weeks of a green light.
