Atticus deck v6: slide copy and build notes

Pre-seed deck. Ten slides plus two optional appendix slides. Numbers below are the live public records as of 2026-09-24 23:28 UTC; refresh the two proof numbers the morning you send.

Build rules

- One idea per slide. Headline states the idea in plain words; body is at most 40 words.
- One number per slide where a number exists. Never two competing numbers.
- Real screenshots only (the retail card, the two track-record pages). No generated art, no stock photos, no icons.
- Black text, white background, the gold accent used once per slide at most.
- Every claim on slides 5 and 8 has a public URL. Put the URL in small type on the slide.
- Corrections to v5 that must not survive: "daily credit" (it is a weekly Friday tenor, credit paid up front), "knockout" (there is none; the holder can release upside at the live price any time), "10% published, 20% founding" fee lines (live take is 20% of the net credit, nothing else), "live on Hyperliquid rails" (we wrap Hyperliquid positions; the hedge is on listed BTC options), the three side products on the solution slide (Leverage Extension, Bad-Debt Shield, Volume Facility go to an appendix or get cut).

Slide 1: Title

Protection that pays the trader.

Atticus | Earn & Protect

A hard floor and a cash credit on any open position. One tap. Hedged leg for leg.

Pre-seed · September 2026 · Michael William · michael@atticustrade.com

Speaker note: Say the headline and stop. The whole deck is that sentence.

Slide 2: Problem

Every venue sells leverage. Nobody sells the floor.

- A stop-loss is an exit, not protection. It fires on the wick and puts you out before the recovery.
- Traders will not pay for insurance. Thirty years of retail data says so.
- So venues run on liquidations. Liquidations end accounts. Ended accounts do not come back.

Footer line: Hyperliquid's newest answer, September 21, 2026: trailing stops. Still an exit.

Speaker note: The venue has a growth problem, not a protection problem. Liquidated users are lost lifetime value. Keep the trader in the trade and the venue keeps the trader.

Slide 3: Solution

Pick a floor. Get paid today. Keep your position.

[Screenshot: the retail card, mid-tap, showing floor, credit, and "Release my upside".]

- Hard floor to Friday. If price falls through it, the floor pays.
- Cash credit paid up front for selling upside you were not going to use.
- Release my upside any time at the live price. One tap on, one tap off.

Small type: Under the hood it is a collar on listed options, netted across holders and hedged leg for leg. Atticus carries zero market risk.

Speaker note: Do not explain options. Explain the three bullets. If asked "how", the answer is one sentence: we buy the put and sell the call for them on a listed venue, and we never hold the difference.

Slide 4: Why this beats the tools venues are shipping

A stop gets you out. A floor keeps you in and pays you.

	Trailing stop	Earn & Protect
On a wick	Sells you out at the low	Floor holds. You stay in.
Cost	Free, then you eat the exit	Pays you cash up front
Setup	Distance, activation price, size	One tap
Undo	Re-enter and pay the spread again	Release my upside at the live price
Who hedges it	Nobody. Your risk.	Atticus, leg for leg, on a listed book

Footer line: Hyperliquid shipped trailing stops on September 21. Our perp record restarted the same day. Simpler for the trader, and the trader gets paid.

Speaker note: This is the "why us and not the venue" slide. Venues ship exits because exits are free to build. A floor needs an options book, netting and a hedge desk. That is us.

Slide 5: Proof, two live public records

Both products run in public. Append-only. Never re-marked.

Perps (facility.atticustrade.com), since September 21:

- 343 positions protected · $13.9M notional · 0 quotes refused
- $12,398 credit paid to holders · 8.9 bps of notional
- 37 early releases priced at the live book · first weekly settlement Friday, September 25

Event contracts (atticus-event-shadow.onrender.com), since September 12:

- 491 positions protected · 400 settled · 169 floor saves (42%)
- Our P&L on settled positions $102.50 = booked take $102.50 · gap $0.00
- Every hedge leg priced off Kalshi or Polymarket depth at the time of the trade

Speaker note: The identity line is the whole slide. Our P&L equals our published take to the cent because we never hold risk. Anyone can download the CSV and sum it. Refresh these six numbers the morning you send.

Slide 6: Event markets, embed instead of aggregate

$16B a week now trades on Kalshi and Polymarket. Their traders have no floor.

- New apps are showing up around the venues: aggregators, third markets, hedge tools. Every one pulls the trader off the venue and keeps the spread.
- We embed inside the venue. The trader never leaves. The venue earns a share of our take. Our hedge legs land on the venue's own book.
- A third-market app will not share revenue. A venue will not send its traders elsewhere to hedge. We solve both.

Small type: Kalshi and Polymarket Global weekly contract volume, September 14 to 20, 2026: $16.4B (Kalshi $15.3B). Roughly a third of Kalshi's daily flow arrives through Robinhood. Distribution wins this market; we are a feature inside the distribution.

Speaker note: Sports and crypto event markets settle in hours, so floor saves show up fast. Our record: 169 floor saves in 400 settled contracts. No venue offers this today and none can build it without a hedge desk.

Slide 7: Business model

We keep 20% of the credit. The trader keeps 80%. Venue fees pass through at cost.

Live record, four days, $13.9M wrapped:

- Gross credit from the options book: $23,593
- Venue fees, passed through: $8,095
- Paid to traders: $12,398
- Atticus: $3,100 (about 2.2 bps of notional wrapped)
- Fees fall with RFQ pricing and volume tiers. Every basis point saved goes to the trader and to us, in the same 80/20.
- Embedded venues take a share of our 20%. Set per partner.

Illustrative: $50M a day wrapped at today's take is about $4M a year. That is one mid-size venue.

Speaker note: Revenue is never trading P&L. If a partner asks what happens in a crash, the answer is on slide 5: the floor pays because the put pays; our number does not move.

Slide 8: Why now

Venues are racing to become derivatives exchanges. They are building the spot layer. We are the derivatives layer above all of them.

- Hyperliquid: about $240B in perp volume in the last 30 days, roughly a third of all perp DEX volume. September 21: trailing stops.
- Hyperion DeFi (Nasdaq: HYPD), CFO David Knox, public post September 2026: bring non-native infrastructure teams onto Hyperliquid. We replied. He took it to his CEO the same day.
- Kalshi: first $3B day, September 20. Distribution through Robinhood, Coinbase, Webull, Moomoo. Prediction markets are becoming brokerage features, and features need protection.
- Kraken simplified options (July), Binance US stock options (September), SGX perps filed with the CFTC (September).

Footer line: We started 18 months ago. Both products run in public today.

Speaker note: The Knox item is the strongest line in the deck. Say it exactly as it happened and no more. Do not say a deal is in progress.

Slide 9: Team

Michael William, founder. Sole builder of everything that is live.

- Built and runs both public records: perp protection wrapping Hyperliquid positions with hedges on listed BTC options; cross-venue event protection routing Kalshi and Polymarket; append-only public ledgers for both.
- Co-founded William Ting Capital: hedge fund access for the digital-wealth generation.
- Built audiences before markets: EP, writer and animator with CollegeHumor and Machinima; co-created a 12-episode animated series for El Rey Network. The same skill runs Atticus distribution.

First hires with this round: founding engineer (execution infrastructure) and a markets/BD lead.

Speaker note: Investors at this stage are buying the founder. The proof that you can ship alone is slide 5.

Slide 10: The ask

$400k pre-seed SAFE. The check turns on live hedging.

- $50k: hedge collateral at OKX and Kalshi. A deposit, not burn. Turns the shadow book live.
- $200k: founding engineer, 12 months.
- $100k: founder salary, travel, legal and compliance path.
- $50k: reserve for a second hedge venue (Bullish or Deribit) and an RFQ line.

Three milestones, twelve months:

1. First live hedged positions on both records, same public ledgers.
2. First venue embed live with a signed revenue share.
3. RFQ dealer line that cuts venue fee drag by half.

Footer line: Accepting $250k to $500k. $5M post-money cap. First close at $250k committed.

Speaker note: Say "the platform is running; this is the collateral and the first hire." Then stop talking and let them ask about the cap.

Appendix A (optional): Trade flow

Trader taps Protect → venue passes the position to the Atticus API → live-book pricing on listed options → hedge legs placed leg for leg → weekly settlement against the venue's own mark → floor pays or upside is released.

Keep the v5 diagram, remove "regime gate" and "7.8% margin netting factor" from the slide. Those are answers to questions, not slide copy.

Appendix B (optional): Who else does this

- Venues (Kalshi, Polymarket, Hyperliquid, Coinbase): rails, not rivals. They have the traders and no options book.
- Aggregators and third-market apps: take the trader off the venue and keep the spread. Venues will not integrate them.
- Legacy structurers (buffer ETFs, OTC desks): monthly tenors, minimum tickets, no retail card.
- Options vaults: sell upside for yield with no floor. That is half the product and the wrong half.
- Status quo: stop-losses and hope.

Neutrality is the moat. We hedge on whichever venue is best for that trade and share revenue with the venue that sent it.

Why the smaller ask closes faster

- $2M seed for a solo founder with no revenue asks a fund to lead. Leads take months and want a co-founder. $250k to $500k fills with four to eight angel and micro-fund checks, each of which can close in a week.
- The use of funds is checkable. $50k of it is a deposit that comes back. The engineer is the only real burn. That is a story an angel repeats to the next angel in one sentence.
- Milestones are binary and public. "First live hedged position on the same ledger" is a link, not a slide. Every check written after that is on a live book.
- A $5M cap is defensible with two public records and zero revenue. Push higher only after the first embed signs.

Five answers to keep in your pocket

- "Why won't the venue build this?" A floor needs an options book, netting across holders and a hedge desk. Venues ship exits because exits are free. Hyperliquid's trailing stops are the evidence.
- "Where is the regulatory risk?" We are a protection feature on a position the trader already holds, hedged on regulated or listed venues. The venue owns the customer and the KYC.
- "What breaks in a crash?" Our P&L is the published take, not the hedge. The record shows the gap at $0.00 across 400 settlements. A crash pays floors from puts we already bought.
- "Why is the fee drag 34% of gross credit?" Because we pay taker fees on a listed book with no volume tier. RFQ and tiers cut that, and the saving goes 80/20 to the trader and us.
- "Who is the customer?" The venue. The trader is the venue's customer and stays that way.

Source lines for the market slide

- Hyperliquid 30-day perp volume about $239B, 36% of tracked perp DEX volume: DeFiLlama snapshot reported September 17, 2026.
- Hyperliquid trailing stops: app.hyperliquid.xyz announcement dated 9/21/2026.
- Kalshi and Polymarket Global weekly contract volume $16.43B, September 14 to 20, 2026; Kalshi $15.27B; first $3B day September 20: DefiRate weekly report.
- Kalshi distribution via Robinhood, Coinbase, Webull, Moomoo; roughly a third of daily flow via Robinhood: Artemis data as reported week ending September 13, 2026.
