

Atticus Client Profile Simulation

Earn & Protect applied to a composite Fireblocks client. Prepared for Fireblocks, August 2026.

Reading guide. Every figure is tagged **MEASURED** (from our 35-day machine-audited facility record or real fills) or **MODELED** (measured rates applied to this profile). Where we have no measured basis, we say so rather than estimate. A dedicated live shadow run of this exact profile, machine-audited over two weeks, is available on request.

1. The Client Profile (composite)

ATTRIBUTE	VALUE
Type	Crypto-native fund, BTC treasury custodied at Fireblocks
Treasury sleeve	\$10,000,000 BTC, held long-term in qualified custody
Active sleeve	\$2,000,000 average directional perp exposure on Hyperliquid, both directions
Objective	Yield on protected exposure without principal drawdown, zero custody movement

2. Active Sleeve: Daily Protection Cycles

Each day the active book is wrapped in one tap: a hard floor about 5 to 6% below spot, a daily credit funded by the options market, automatic re-arm after any cap touch. Read-only: positions read from public data, hedges placed from Atticus accounts, credits paid to the client's address.

LINE (90-DAY HORIZON)	VALUE	BASIS
Average protected notional	\$2,000,000	MODELED (profile input)
Gross credit rate at block execution	8.5 bps/day	MEASURED (facility, \$50k-scale tape)
Gross credits, 90 days	\$153,000	MODELED = \$2M x 8.5 bps x 90
Client share (80% or better)	\$122,400+	MODELED (published take, institutional tiers)
Expected floor events	~1 of 90 cycles	MEASURED frequency 1.12% of positions
Expected cap touches (auto re-arm, credit kept)	~4 of 90 cycles	MEASURED frequency 4.49% of positions
Days positive for clients across the measured window	79%	MEASURED (89 settled positions)
Client all-in result across the full measured window	+4.5 bps on notional	MEASURED (credits + protection + funding, net)

3. The Stress Exhibit: a Real 7.5% Day (measured, August 19, 2026)

The facility lived through a 7.5% single-session move during the measured window. Below is what actually happened, per \$50,000 position, both directions. For this profile's \$2M active sleeve, multiply by 40.

DIRECTION	POSITION P&L	COLLAR SETTLEMENT	CREDIT	CLIENT NET	WHAT THE STRUCTURE DID
Long \$50k (price rose 7.5%)	+\$3,796	-\$2,886	+\$29	+\$921	Cap engaged above the knockout: client kept gains to the cap plus vested credit; cycle re-armed at the new spot
Short \$50k (price moved 7.5% against)	-\$3,774	+\$950	+\$48	-\$2,776	Floor engaged: the collar paid out and absorbed the loss beyond the floor; without protection the loss is the full -\$3,774

The point of the exhibit: on the worst day in the window, floors paid, caps behaved, no manual intervention occurred, and the facility's cumulative result remained positive. Protection is measured on the day it is needed, not the days it is not.

4. Controls and Audit (all measured, entire window)

CONTROL	RESULT
Independent oracle verification of every position	100%
Reconciliation against venue records, sessions with drift	100% / 0
Peak net market exposure of the Atticus book	0
Lifecycle completion without intervention	99.97%
Honest refusals (market could not fund a credit)	1 of 94 attempts

5. Treasury Sleeve: Stated Honestly

The \$10M treasury sleeve calls for rolling monthly collars rather than daily cycles. The engine supports the structure (tenor is a parameter; strikes and expiries come from the same listed chain), but we have not yet run a measured monthly-tenor tape, and our operating rule is that nothing is shown to a client before it is measured. Term pricing for this sleeve is exactly what the design-partner phase produces: two weeks of dedicated, machine-audited shadow operation against this profile, treasury sleeve included. That run is available on request.

6. Next Step

Name the real client and their requirements. We configure this simulation to their actual book, run it live in the shadow facility with full audit output, and present the results alongside the working branded

demo. From a green light, a funded design-partner pilot is live inside weeks on the OKX plus FalconX execution stack.

Atticus Trade, Inc. Measured figures come from a 35-day machine-audited shadow facility operating at real market prices with zero capital at risk, and from real executed fills on listed options venues. Modeled figures apply measured rates to the stated composite profile. Nothing in this document is investment advice or an offer of any financial product. Contact: hello@atticustrade.com
