Atticus deck v6: slide copy and build notes

Pre-seed deck. Ten slides plus two optional appendix slides. Numbers below are the live public records as of 2026-09-25 18:49 UTC, after the first weekly perp settlement; refresh the proof numbers the morning you send.

Screenshots for the slides are in `assets/` next to this file (all captured from the live demos and records at 2x on 2026-09-25):

- `slide3_perp_headline_and_card.png`: the landing headline and the toggled card together.
- `slide3_perp_card_toggled.png`: the card alone. Long BTC $128,484, this week's credit $192.58, floor $79,000, cap $87,000, pays Friday.
- `slide5_perp_record_kpis_2026-09-25.png` and `slide5_perp_record_identity_2026-09-25.png`: the perp track record top block and the "we carry no outcome risk" row.
- `slide5_event_record_kpis_2026-09-25.png`: the event track record top block and identity.
- `slide6_event_phone_protected.png` and `slide6_event_protect_sheet.png`: the embed with the Astros row protected and the confirmation sheet.
- `slide8_hyperliquid_trailing_stops_with_reply.png`: Hyperliquid's trailing-stop announcement with our reply beneath it (phone capture, September 21).
- `slide8_robinhood_hood_summit.png`: Robinhood's "The retail trader is evolving, and so is the options market" post for HOOD Summit (phone capture, September 25).

Slide map: 1 title, 2 problem, 3 solution (perps), 4 versus the tools venues ship, 5 proof, 6 event markets, 7 business model, 8 why now, 9 team, 10 ask. Team and ask stay separate slides.

How the two products differ (a build note, not a slide)

Slide 3 shows the perp product and slide 6 shows the event product; the difference is seen, not explained. Do not add a slide for this.

- Perps: one toggle. The engine finds the floor and the cap on the live options book. The trader picks nothing. The credit unlocks through the week and pays Friday at the cycle close, never up front. The collar runs to Friday; the cap can be bought back at the live listed price, and that is shown on the institutional skin only. Nothing to manage.
- Events: one tap on the position row. The floor and the cash are shown before the tap; the cash is added to the balance at protect time. Where the market supports it the embed offers three floor tiers (tight, balanced, wide) with the default chosen for the trader.

Build rules

- One idea per slide. Headline states the idea in plain words; body is at most 40 words.
- One number per slide where a number exists. Never two competing numbers.
- Real screenshots only (the retail card, the two track-record pages). No generated art, no stock photos, no icons.
- Black text, white background, the gold accent used once per slide at most.
- Every claim on slides 5 and 8 has a public URL. Put the URL in small type on the slide.
- Corrections to v5 that must not survive: "daily credit" (it is a weekly Friday tenor; the credit unlocks through the week and pays Friday), "knockout" (there is none; the collar runs to Friday and the cap can be bought back at the live price), "10% published, 20% founding" fee lines (live take is 20% of the net credit, nothing else), "live on Hyperliquid rails" (we wrap Hyperliquid positions; the hedge is on listed BTC options), the three side products on the solution slide (Leverage Extension, Bad-Debt Shield, Volume Facility go to an appendix or get cut).
- Never write "pick a floor" for perps. The engine picks. Never show a release button; the retail card has none.

Slide 1: Title

One toggle. A hard floor. And it pays.

Atticus | Earn & Protect

A hard floor and a cash credit on any open position. Nothing to manage. Hedged leg for leg.

Pre-seed · September 2026 · Michael William · michael@atticustrade.com

Speaker note: Say the headline and stop. The whole deck is that sentence.

Slide 2: Problem

Every venue sells leverage. Nobody sells the floor.

- A stop-loss is an exit, not protection. It fires on the wick and puts you out before the recovery.
- Traders will not pay for insurance. Thirty years of retail data says so.
- So venues run on liquidations. Liquidations end accounts. Ended accounts do not come back.

Footer line: Hyperliquid's newest answer, September 21, 2026: trailing stops. Still an exit.

Speaker note: The venue has a growth problem, not a protection problem. Liquidated users are lost lifetime value. Keep the trader in the trade and the venue keeps the trader.

Slide 3: Solution

One toggle. A hard floor. And it pays.

[Screenshot: `assets/slide3_perp_card_toggled.png`. Long BTC, $192.58 this week's credit, $79,000 floor, $87,000 cap, pays Friday.]

- Flip protection on any perp position. The engine finds the floor and the cap on the live options book.
- A hard floor under the position to Friday. Losses stop there.
- A credit, funded by the options market, unlocks through the week and pays Friday.
- Nothing to set. Nothing to manage. Refuses when the market cannot fund an honest credit.

Small type: Under the hood it is a collar on listed options, netted across holders and hedged leg for leg. Atticus carries zero market risk.

Speaker note: This headline is the landing page; keep the deck and the product saying the same sentence. Do not explain options. If asked "how", one sentence: we buy the put and sell the call for them on a listed venue, and we never hold the difference. If asked "can the trader change the floor", the answer is no, and that is the point: the trailing stop asks for three settings, this asks for none.

Slide 4: Why this beats the tools venues are shipping

A stop gets you out. A floor keeps you in and pays you.

	Trailing stop	Earn & Protect
On a wick	Sells you out at the low	Floor holds. You stay in.
Cost	Free, then you eat the exit	Pays you a credit every week
Setup	Distance, activation price, size	One toggle. The engine picks the floor and the cap.
Undo	Re-enter and pay the spread again	The cap can be bought back at the live listed price; the floor stays either way
Who hedges it	Nobody. Your risk.	Atticus, leg for leg, on a listed book

Footer line: A trailing stop is a promise you make to sell into a falling market. A floor is a promise someone else already made to buy.

(That is our public reply to Hyperliquid's trailing-stop announcement on September 21, the day our perp record restarted. The screenshot of both is on slide 8.)

Speaker note: This is the "why us and not the venue" slide. Venues ship exits because exits are free to build. A floor needs an options book, netting and a hedge desk. That is us. The "undo" row is a pocket fact, not a feature: the retail card does not show a release button, by design.

Slide 5: Proof, two live public records

Both products run in public. Append-only. Never re-marked.

Perps (facility.atticustrade.com), since September 21:

- 410 positions protected · $16.3M notional · 0 quotes refused
- $14,763 credit to holders · 9.1 bps of notional · 45 early closes priced at the live book
- First weekly settlement, September 25: 68 settled · our P&L $548.44 = booked take $548.44 · gap $0.00

Event contracts (atticus-event-shadow.onrender.com), since September 12:

- 516 positions protected · 427 settled · 180 floor saves (42%)
- Our P&L on settled positions $116.83 = booked take $116.83 · gap $0.00
- Every hedge leg priced off Kalshi or Polymarket depth at the time of the trade

[Layout: the "we carry no outcome risk" images are this slide. Perp identity row (`assets/slide5_perp_record_identity_2026-09-25.png`) across the top, event identity block (`assets/slide5_event_record_kpis_2026-09-25.png`) beside or under it, both reading P&L = take, gap $0.00. Cut the bullets to two per product if the slide is crowded. This is the only slide that carries these images; slide 7 points back to it.]

Speaker note: The identity line is the whole slide. Our P&L equals our published take to the cent, on both products, because we never hold risk. Anyone can download the CSV and sum it. Refresh these numbers the morning you send. If asked about the first perp settlement: 68 positions, none fell to the floor, one ended past the cap and handed back $10.00 of gains against $13.71 of credit, 67 settled between the wings with the full credit; $2,193.60 went to holders.

Slide 6: Event markets, embed instead of aggregate

$16B a week now trades on Kalshi and Polymarket. Their traders have no floor.

- New apps are showing up around the venues: aggregators, third markets, hedge tools. Every one pulls the trader off the venue and keeps the spread.
- We embed inside the venue. The trader never leaves. The venue earns a share of our take. Our hedge legs land on the venue's own book.
- A third-market app will not share revenue. A venue will not send its traders elsewhere to hedge. We solve both.

[Screenshot: `assets/slide6_event_phone_protected.png` . The Astros row protected inside "Your Exchange", the sheet reading "ends $70.59 or $102.09, +$4.59 added to your cash, Nothing to manage."]

One tap on the position row. Floor and cash shown before the tap. Three floor tiers when the market supports them; the default is chosen for the trader.

Small type: Kalshi and Polymarket Global weekly contract volume, September 14 to 20, 2026: $16.4B (Kalshi $15.3B). Roughly a third of Kalshi's daily flow arrives through Robinhood. Distribution wins this market; we are a feature inside the distribution.

Speaker note: Sports and crypto event markets settle in hours, so floor saves show up fast. Our record: 180 floor saves in 427 settled contracts. No venue offers this today and none can build it without a hedge desk.

Slide 7: Business model

We keep 20% of the credit. The trader keeps 80%. Venue fees pass through at cost.

Live record, five days, $16.3M wrapped:

- Gross credit from the options book: $27,949
- Venue fees, passed through: $9,495
- Credit to holders, paid at each Friday close: $14,763
- Atticus: $3,691 (about 2.3 bps of notional wrapped)
- Fees fall with RFQ pricing and volume tiers. Every basis point saved goes to the trader and to us, in the same 80/20.
- Embedded venues take a share of our 20%. Set per partner.

Illustrative: $50M a day wrapped at today's take is about $4M a year. That is one mid-size venue.

Speaker note: Revenue is never trading P&L. The first Friday close booked $548.44 of take on 68 settled positions and our P&L was $548.44. If a partner asks what happens in a crash, the answer is on slide 5: the floor pays because the put pays; our number does not move.

Slide 8: Why now

The venues are saying it themselves.

Three screenshots across the slide, one line under each:

1. `assets/slide8_hyperliquid_trailing_stops_with_reply.png`. Hyperliquid, September 21: "Trailing stops are now available for perp markets." Our reply beneath it. Line: The biggest perp venue ships exits. We ship the floor.
2. `assets/slide8_robinhood_hood_summit.png`. Robinhood, September 25: "The retail trader is evolving, and so is the options market." Steve Quirk with Cboe at HOOD Summit, September 29, on 0DTE and expanded access. Line: The biggest retail broker says options are the retail product now.
3. David Knox, CFO, Hyperion DeFi (Nasdaq: HYPD), public post, September 2026: bring non-native infrastructure teams onto Hyperliquid. Line: We replied. He took it to his CEO the same day.

Small type under the images: Hyperliquid about $240B perp volume in 30 days, roughly a third of all perp DEX volume. Kalshi and Polymarket $16.4B in one week, Kalshi's first $3B day September 20, a third of its flow arriving through Robinhood.

Footer line: We started 18 months ago. Both products run in public today.

Speaker note: Say each screenshot in one sentence and move on; the images do the work. The Knox item is the strongest line in the deck. Say it exactly as it happened and no more. Do not say a deal is in progress. Pocket facts if asked "why now" a second time: Kraken simplified options (July), Binance US stock options (September), SGX perps filed with the CFTC (September), the CFTC path for Hyperliquid via Bitnomial (Bloomberg Businessweek, September 24).

Slide 9: Team

Michael William, founder. Sole builder of everything that is live.

- Built and runs both public records: perp protection wrapping Hyperliquid positions with hedges on listed BTC options; cross-venue event protection routing Kalshi and Polymarket; append-only public ledgers for both.
- Co-founded William Ting Capital: hedge fund access for the digital-wealth generation.
- Built audiences before markets: EP, writer and animator with CollegeHumor and Machinima; co-created a 12-episode animated series for El Rey Network. The same skill runs Atticus distribution.

First hires with this round: founding engineer (execution infrastructure) and a markets/BD lead.

Speaker note: Investors at this stage are buying the founder. The proof that you can ship alone is slide 5.

Slide 10: The ask

$400k pre-seed SAFE. The check turns on live hedging.

- $50k: hedge collateral at OKX and Kalshi. A deposit, not burn. Turns the shadow book live.
- $200k: founding engineer, 12 months.
- $100k: founder salary, travel, legal and compliance path.
- $50k: reserve for a second hedge venue (Bullish or Deribit) and an RFQ line.

Three milestones, twelve months:

1. First live hedged positions on both records, same public ledgers.
2. First venue embed live with a signed revenue share.
3. RFQ dealer line that cuts venue fee drag by half.

Footer line: Accepting $250k to $500k. $5M post-money cap. First close at $250k committed.

Speaker note: Say "the platform is running; this is the collateral and the first hire." Then stop talking and let them ask about the cap.

Appendix A (optional): Trade flow

Trader taps Protect → venue passes the position to the Atticus API → live-book pricing on listed options → hedge legs placed leg for leg → weekly settlement against the venue's own mark → floor pays or upside is released.

Keep the v5 diagram, remove "regime gate" and "7.8% margin netting factor" from the slide. Those are answers to questions, not slide copy.

Appendix B (optional): Who else does this

- Venues (Kalshi, Polymarket, Hyperliquid, Coinbase): rails, not rivals. They have the traders and no options book.
- Aggregators and third-market apps: take the trader off the venue and keep the spread. Venues will not integrate them.
- Legacy structurers (buffer ETFs, OTC desks): monthly tenors, minimum tickets, no retail card.
- Options vaults: sell upside for yield with no floor. That is half the product and the wrong half.
- Status quo: stop-losses and hope.

Neutrality is the moat. We hedge on whichever venue is best for that trade and share revenue with the venue that sent it.

Why the smaller ask closes faster

- $2M seed for a solo founder with no revenue asks a fund to lead. Leads take months and want a co-founder. $250k to $500k fills with four to eight angel and micro-fund checks, each of which can close in a week.
- The use of funds is checkable. $50k of it is a deposit that comes back. The engineer is the only real burn. That is a story an angel repeats to the next angel in one sentence.
- Milestones are binary and public. "First live hedged position on the same ledger" is a link, not a slide. Every check written after that is on a live book.
- A $5M cap is defensible with two public records and zero revenue. Push higher only after the first embed signs.

Five answers to keep in your pocket

- "Why won't the venue build this?" A floor needs an options book, netting across holders and a hedge desk. Venues ship exits because exits are free. Hyperliquid's trailing stops are the evidence.
- "Where is the regulatory risk?" We are a protection feature on a position the trader already holds, hedged on regulated or listed venues. The venue owns the customer and the KYC.
- "What breaks in a crash?" Our P&L is the published take, not the hedge. The records show the gap at $0.00 across 427 event settlements and the first 68 perp settlements. A crash pays floors from puts we already bought.
- "Can the trader undo it?" The position is the trader's the whole time; the collar runs to Friday. The cap can be bought back at the live listed price (shown on the institutional skin). Turning the toggle off is not a free exit and the card does not pretend it is.
- "Why is the fee drag 34% of gross credit?" Because we pay taker fees on a listed book with no volume tier. RFQ and tiers cut that, and the saving goes 80/20 to the trader and us.
- "Who is the customer?" The venue. The trader is the venue's customer and stays that way.

Source lines for the market slide

- Hyperliquid 30-day perp volume about $239B, 36% of tracked perp DEX volume: DeFiLlama snapshot reported September 17, 2026.
- Hyperliquid trailing stops: app.hyperliquid.xyz announcement dated 9/21/2026.
- Kalshi and Polymarket Global weekly contract volume $16.43B, September 14 to 20, 2026; Kalshi $15.27B; first $3B day September 20: DefiRate weekly report.
- Kalshi distribution via Robinhood, Coinbase, Webull, Moomoo; roughly a third of daily flow via Robinhood: Artemis data as reported week ending September 13, 2026.
