

Atticus Unit Economics

Earn & Protect: how the product earns, what collateral does, and what protects it. August 2026.

Reading guide. Every figure is labeled **MEASURED** (real fills or real simulations we ran) or **ESTIMATE** (theory we verify before anything is promised to a trader). This document pairs with the Atticus Shadow Facility Report, which contains the 33-day machine-audited track record.

1. The Product in Four Sentences

A Hyperliquid trader taps one toggle. The options market pays them a daily credit and puts a hard floor under their position. Their funds never move: no deposit, no keys, nothing to learn. Toggle on: credit plus floor. Toggle off: neither. Everything else is identical.

It is the collar strategy institutional desks run every day, executed in one tap. We place both option legs on a listed venue from our own sub-account; the difference between the sold cap and the bought floor is the trader's credit.

2. The Business

20%

OUR CUT OF EVERY CREDIT
SOURCED

10%

FOUNDING RATE, FIRST 50
WALLETS

~8.5 bps/day

CREDIT RATE AT BLOCK
EXECUTION **MEASURED**

Revenue is a published spread on the credit we source. Every wrap is fully hedged leg for leg; the book carries no directional risk. When the market cannot fund an honest credit, the engine refuses to open, by design.

3. What the Collateral Does

Collateral is not spend and not trading capital. It sits in an OKX sub-account as options margin, verifiable by independent read-only API access. Margin is consumed while a wrap is open and returns at the daily close, so the same capital backs a book that recycles every day.

LINE	AMOUNT
Pilot collateral	\$10,000
Usable as margin (40% held back as a permanent safety buffer)	\$6,000

Margin per protected dollar MEASURED on OKX's own margin simulator	~12%
Working book supported, recycling daily	~\$50,000

Scaling is linear: \$400k of collateral supports roughly \$2M/day of protection; \$2M supports roughly \$10M/day. The shadow facility additionally measured portfolio-margin netting at 0.078, meaning paired structures require a small fraction of naive margin as the book matures.

4. What It Earns

Daily credit per position, across execution tiers.

POSITION SIZE	RETAIL FILLS TODAY MEASURED	BLOCK EXECUTION MEASURED	THEORY CEILING ESTIMATE
\$650	\$0.04 to \$0.49	~\$0.55	\$0.65 to \$1.95
\$2,000	\$0.12 to \$1.47	~\$1.70	\$2 to \$6
\$15,000	\$0.90 to \$11	~\$12.60	\$15 to \$45

Atticus revenue at the measured block tier (20% of gross credit).

PROTECTED BOOK PER DAY	COLLATERAL BEHIND IT	GROSS CREDIT/DAY	TO ATTICUS
\$50k (this pilot)	\$10k	~\$42	~\$8/day
\$2M	~\$400k	~\$1,680	~\$336/day (~\$120k/yr)
\$10M	~\$2M	~\$8,400	~\$1,680/day (~\$600k/yr)

Credits grow with four levers: position size (always linear), execution tier (block RFQ pricing measured 2 to 5 times better than retail fills), volume density (long and short wraps net internally, so our hedge orders reach block size sooner), and volatility (busy days pay multiples of quiet ones; we measure it, we do not promise it).

The \$10k pilot is deliberately a traction play, not a revenue story: it proves live demand with real money, measures the real economics, and prices the actual raise from a working book.

5. What Protects the Collateral

LAYER	PLAIN READING
Withdrawal-disabled API keys	Keys are trade-only at the venue level. Even a total server compromise cannot move funds off the exchange.
Independent visibility	The capital partner holds their own read-only API access to the sub-account at all times.
Atomic pairs	Both option legs fill or the pair auto-unwinds. A fill worse than the quoted credit auto-unwinds. Enforced in code, proven on real orders.
Permanent buffer	40% of capital is never allocated. Utilization auto-pauses new wraps before the buffer is touched. A kill switch stops new exposure while payouts keep running.
Concentration caps	Book, per-wallet, and per-strike caps bound exposure. The payout wallet is separate, small, and per-day capped: its float is the maximum blast radius.
Full reconciliation	Every wrap, fill, and payout is recorded and reconciled against the venue's own records. A public dashboard shows the live book.

6. Where It Stands

Built, tested, and track-record clean.

Pricing, atomic execution, the daily cycle with cap-touch handling and automatic re-arm, payouts, caps, and branded trader apps (web and Telegram) are complete, covered by 558 automated tests. Real-money canary fills have executed on OKX with every hedge auditable to an exchange fill. The companion Shadow Facility Report documents 33 days of continuous machine-audited operation: 100% oracle-verified, 100% reconciled, clients net positive through a 7.5% market move day.

Week one after funding: measure real portfolio margin per wrap (sets the true book size) and run live wraps across a full week of market hours (sets the true credit numbers). Nothing is promised to traders until both are measured. That discipline is the product.

Atticus builds protection infrastructure for trading venues. Figures labeled measured come from real fills or real simulations and are documented. Nothing in this document is investment advice. Contact: hello@atticustrade.com
