The other side of retail protection, pre-game, across your venues.

A retail holder on Kalshi, ProphetX or Novig taps **Lock in** on a position they already hold and gets a **floor and a cap** for a credit paid now. Atticus prices it and buys the other side on the exchange's book, at the **cheapest venue all in, venue fees included**. No off-exchange trade: the holder's position stays on the exchange, and so does the other side. What comes out is a flow your venues do not carry today: **the opposing outcome of what retail already holds, bought pre-game, with no view.**

WHAT IT IS WORTH TO AN EXECUTION LAYER

Flow your desks only meet on the screen

Every order is the opposite side of a position a retail holder owns, placed pre-game: the holder is reducing a position, not expressing a view. About as uninformed as flow gets. Today it meets whoever is on the screen.

A client already on your venues

We built a cross-venue router because this flow needed one: ask every venue, rank all in with fees and settlement rules folded in. That is your stack's work; **one integration beats four adapters.**

Demand the screens cannot fill

Last week, of 100 positions put to every venue, **71 had one book** able to price the other side. **23 of 232 markets** were declined: the other side cost too much on the screens to leave a worthwhile credit. Measured weekly, in public.

HOW IT FITS, IN SEQUENCE

NOW Live across your venues with our own router. The record and the venue scoreboard are public and weekly: **the flow and its venue comparison are there to read**, nothing to integrate.

NEXT The other side routed through River's execution API in place of four venue adapters; your desks see it on the screens first. One client, one new flow type. **Size grows with the venues' holders, not on a promise.**

LATER Where the screens are thin, a quote request for the other side at size to your desks, filled on the venue, screen as fallback: the shape our perpetuals stack runs today. Positions and margin consolidated across venues as your capital work ships. **The hedge is paid for by the credit**: a leg that funds itself is the easiest one to finance.

THE RECORD, LIVE SINCE SEP 12, 2026

1,322 positions protected, 1,124 settled

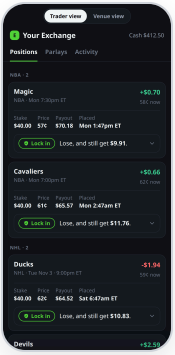

2.0% cost of the floor, of stake, realized (2.5% quoted)

43% floor saves: holder finished above the unprotected outcome

659 positions priced in the last 4 weeks

Gap $0.01
on 1,124 settled

Our P&L equals the take booked at quote time, to the cent, across every settled position. We earn the published take and nothing on the result; the holder's credit is net of it. MLB, Bitcoin strikes, NFL, NBA, NHL; 113 parlay tickets, 41 locks priced at the last pick. Every row public, with a receipt; refusals recorded beside the fills.

The retail origin. Their venue's shell, our line under every position: one tap, two endings, cash now. The receipt names the venue that took the other side. Delivered as an embed in the venue's app or as a browser extension.

WHERE THE OTHER SIDE WENT · WEEK OF OCT 26 – NOV 1

VENUE	SINGLES other side won · n	FEE ¢ per contract	PRICED WHEN ASKED of 100 positions
Kalshi	**65.6%** 135	0.63¢	**100%** 100 of 100
Polymarket	**26.9%** 55	0.00¢	n/a
ProphetX	**<1%** 1	0.72¢	**2%** 2 of 100
Novig	**7.5%** 18	0.00¢	**30.5%** 29 of 95

220 positions (209 singles, 11 parlay locks at the last pick), 31,393 contracts. Kalshi prices every time because it is the market's own book; the others are asked for the same position at the same second. Polymarket is priced on a separate path that records the winner, not the asks, so it has no availability figure. Fee: each venue's schedule at the price paid. Edge over the runner-up and refusals by reason are on the scoreboard.

SCOREBOARD

atticus-event-shadow.onrender.com/scoreboard

By week and venue: other side won, edge, fee, availability, refusals. CSV and JSON at the top.

Trader view and Venue view; ? tab=parlays for the parlays.

WHAT IT IS NOT

A market maker, a signal, or custody. No funds held, no view taken; the P&L is the published take whoever wins.

Michael William, founder · michael@atticustrade.com

Same engine on Bitcoin perpetuals: public shadow facility since July 2026, screen read then block RFQ.

Numbers as of 2026-11-02 21:15 UTC.

Positions on the record are simulated at live prices except the taps, which are real holders' locks.
