Protection inside the venue's app. One tap, paid today.

A user holding a position on a prediction market taps **Lock in**. The position now ends at a **floor** or a **cap**, and part of it is **paid in cash today**. Atticus prices it and hedges it on the other side of the same market. The venue keeps the flow, the ledger and the customer; Atticus never holds funds.

WHAT THE USER SEES

BEFORE
Seahawks · 150 contracts ends $0 or $150

→

ONE TAP
Lock in · +$4.24 now

→

AFTER
ends $67.24 or $106.24
$4.24 paid now

The credit shown is net of our take. Settlement is the venue's official result. When the market cannot fund a credit, we refuse and the refusal is recorded beside the fills.

WHY A VENUE ADDS THE BUTTON

A third choice beside hold and cash out

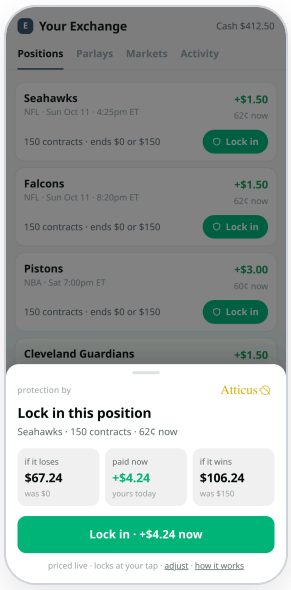

Cash out sells the whole position at the spread. The lock keeps it: a floor, upside to a cap, cash today.

Revenue with no outcome risk

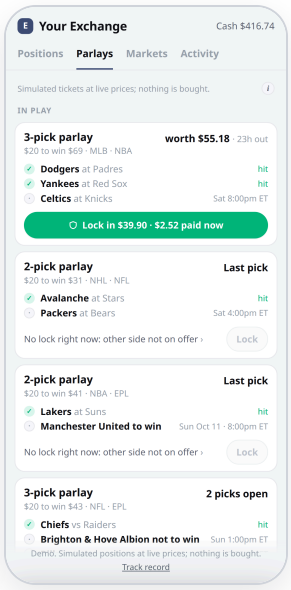

A published take on every protected position, shared with the venue. Our P&L equals that take whoever wins.

One JSON quote in, one receipt out

Your brand, your ledger, your official result. We supply the sheet. Nothing custodial.

Positions. Their shell, our sheet: two endings and the cash paid now. Priced live, locked at the tap.

Parlays. The lock exists only at the last pick; earlier tickets say so, and refusals say why.

THE RECORD, LIVE SINCE SEP 12, 2026

745
positions protected, 699 settled

$104,850
stake settled

$2,204.48
paid to users at the tap

43%
floor saves: user finished above the unprotected outcome

$265.97 our P&L
$265.97 take booked

Gap $0 on all 699 settled positions: our P&L equals the take booked at quote time, to the cent. We earn the published take and nothing on the result. Floor cost 2.3% of stake realized, 2.7% quoted. MLB, Bitcoin strikes, NFL, NBA; hedged on Kalshi and Polymarket. Every row public, with a receipt.

PARLAYS: THE LOCK AT THE LAST PICK

A parlay is a long shot when bought; no honest floor can be priced on it. Once every pick but one has hit, it is a position on **one game at one game's odds**, which is what the layer prices. So the lock appears at the last pick and nowhere before. Since Oct 08: 16 tickets, 8 in play, 8 busted on an early pick; the first lock prices when a ticket reaches its last pick.

SEE IT YOURSELF

Demo	atticus-event-demo-cross-venue.onrender.com Tap Lock in on any row. Add ?tab=parlays for the parlays.
Track record	atticus-event-shadow.onrender.com Every number on this page, live. Identity card at the top; positions export at /api/shadow/positions.csv, one row per position in integer cents.
What it is not	Not a forecast, a signal or a bot. Not custody. Not venue specific: the record settles on Kalshi; the layer runs on any venue with a public book.
